

METHOD AND SYSTEM FOR CACHING OF NON-REALTIME DATA

ABSTRACT OF THE DISCLOSURE

A method and system for generating and presenting a display page before all the desired computations are performed needed to fully populate the display page. The presentation system receives a request to present the display page that includes realtime information and non-realtime information. When generating a display page including both realtime and non-realtime information, the presentation system retrieves the realtime information and requests that the non-realtime information be generated. The presentation system then creates an initial display page that includes the realtime information along with an indication that the generation of the non-realtime information has been requested. When the presentation system next generates that display page, it checks whether the non-realtime information has been generated. If so, the presentation system adds the realtime information and non-realtime information to the display page.
